Work progress :

- Implemented the Causal TCN architecture in PyTorch, ensuring strict causality in convolutional layers to prevent future data leakage.
- Developed the Graph Diffusion Engine to dynamically generate rolling correlation matrices and compute Laplacian residuals for capturing evolving market relationships.
- Designed and integrated the Risk Management Logic, including a Deadband filter to suppress uncertain signals and Volatility Scaling for dynamic position sizing.
- Built the integration layer to connect model-generated buy/sell signals with the Transaction Master and Position Master in the portfolio database, and conducted dry tests to validate end-to-end data flow and signal generation without runtime errors.
